

Unified Inventory & POS System

Ecosystem Development & AI Acceleration Summary

1. Development Metrics

18,179

Lines of Custom Code

JS, JSX, CSS, and HTML

28

Integration Tests

100% success rate

5

Target Formats

Mobile, Desktop, Web, Pi, OS

2. Product Milestones

Ecosystem Core & Scanners

Built a local-first SQLite core for Next.js and compiled a React Native handheld scanner app running Expo Go on iOS/Android, transferring scans securely via local network Wi-Fi or ZIP uploads.

Domain-Aware AI Pipelines

Integrated SerpApi Google Lens and visual Google Vision models to auto-identify coins (Sheldon Scale slab certification lookups), trading cards (PSA/BGS/SGC), comic books, toys, and movies (cast lists and trailers).

Audit Engine & Commission Payouts

Implemented soft-drink OCR PDF sheet count ingestion, specific gravity BLE weight calculations, isolated multi-booth databases (store_[id].sqlite), locked switcher gates, commission calculations, and monospaced 80mm thermal receipt prints.

3. The AI Acceleration Advantage (Human Team vs. AI Pair)

ROLE NEEDED	STANDARD DEV TEAM DELIVERABLE	AI-POWERED SOLO DEVELOPER
Product Manager	Write feature specifications and organize release timeline maps.	Unified Context Efficiency By utilizing Antigravity as an agentic pair-programmer, a single developer executed all 6 roles synchronously. This bypassed communications overhead, code-merge bottlenecks, and API alignment meetings, producing 18,179 lines of tested, production-ready code in a fraction of standard timelines.
Mobile Developer	Build React Native camera captures, offline queues, and local synchronization.	
Backend Engineer	Set up SQLite schemas, session tokens, and multi-booth isolated file routers.	
Frontend Engineer	Design responsive Next.js pages, payout drawer widgets, and print templates.	
QA / Test Engineer	Write the 28 tests for 2FA, specific gravity math, and setup Wizard keys.	
DevOps Engineer	Compile Electron setup packages, configure Tunnels, and link WordPress mirrors.	

Summary: What typically requires a team of 6 engineers working for 3-6 months was successfully conceived, designed, tested, and published live to WordPress by a single developer paired with agentic AI, producing a fully compliant, production-ready antique mall platform.
