

Workspace Cleanup & Archive Manifest

Author	Date Created	Repository
AI Coding Assistant	June 2, 2026	inventory-system-app

To prepare the application for production packaging and clean up the active workspace, we performed a thorough inspection of the repository directory. Standard debug scripts, legacy database migrations, and testing logs used since day one were relocated into the structured `Archive` folder. This manifest documents the relocated assets for educational and auditing purposes.

1. Relocated Development Scripts

The following scripts have been moved to `Archive/development_scripts/`:

check-db.js

Utility to inspect and output the SQLite database tables and seed rows.

fix-changelogs.js

Cleaned formatting and JSON errors in the changelogs database table.

insert-changelog.js

Seed script used to insert structured version updates and changelogs.

insert-db.js

Database insert wrapper used to verify table writes.

publish-blog.js

Standalone helper used to test API requests to the WordPress blog system.

publish-wp.js

Alternative WordPress publisher API prototype.

update-changelog-1.5.0.js

Specialized one-off schema insert for Version 1.5.0 updates.

update-password.js

Script verifying local user registration and password bcrypt hashing logic.

update-prod-db.js

Triggered structure updates on live SQLite production files.

reset_failed.js

Forced reset of Sync statuses during test pipeline hangs.

set_admin.js

Set user status flags to Administrator levels for testing purposes.

test_sqlite.js

Standalone performance benchmark checking concurrent Sqlite writes.

test_vision.js

Local client simulating Google Cloud Vision requests.

migrate.js / migrate_coins.js

Early schema migration scripts verifying custom categories and fields.

migrate_data.js

Migrated pre-alpha unstructured items into relation models.

proxy.js

Legacy authentication middleware replaced by core layout-level JWT validation.

2. Archived Server & Build Logs

The following logs generated during runtime checks and build processes have been moved to Archive/logs/:

- **error.log / server_error.log:** Recorded stack traces from uncaught route rejections.
- **test_server.log (1 through 7):** Captured console output during local background server boots.

3. Retained & Tracked Workspace Additions

In contrast to the archived files, these critical components were staged and tracked in Git to maintain production functionality:

- **web/components/SystemUpdatePanel.js:** Dashboard component polling update APIs and triggering quit-and-install sequences.
- **web/scripts/build-release.js:** Orchestration script compiling Next.js, packaging Electron setups, and auto-publishing releases.
